Subject: Labeling of Centerlines on Survey and R/W Plans

The following is the general policy of the R/W Plans Section, in regards to labeling centerlines on the Results of Survey and on the R/W plan sheets.

If more than one label applies to a centerline, then both (or more) names should typically be used in the label, such as "Existing R/W & N/B Const. centerline" or "Section line & Existing R/W centerline". The exception to this is the use of the label of "survey centerline". This label should not be used, except in some instances, such as for brand new corridor alignments.

For projects wherein the centerline that is serving as the basis of the stations and offsets for the new R/W corners has more than one label, you only need to state one label name in the station and offset reference for each new R/W corner; just consistently use the same label.

In many instances, what was labeled as a survey centerline, or construction centerline on the older existing R/W plans, will now become, and be labeled as, the existing R/W centerline on the new survey and R/W plans.
